PROJECT DETAILS

Project Title	: Low Power High Performance Sleepy SRAM.
Duration	: 3 Months.
No of Members	: 4.
Project Description	: The project aim is to reduce the leakage power in the SRAM, the power gating method is using sleep transistors to control the sub-threshold current. For this project , we extend our discussion and present the result on the advantage of using sleep transistor in terms of delay, area and power reduction. The result of simulating sleepy 1k-bit SRAM in tsmc 90nm process, may result considerable power saving without getting worst-case delay increased.

PROFESSIONAL COURSE

Completed a course in Core Java and J2EE at JSpiders Institute, Rajajinagar, Bangalore.
